Two turbines at the Arkwright Summit Wind Farm Arkwright Summit Wind Farm is a 78.4 megawatt wind farm in Arkwright, New York. It uses 36 Vestas V110 turbines, 32 of which are designed for 2.2 megawatts and 4 of which are estimated at 2.0 megawatts. The wind farm provides electricity to about 35,000 New York homes. The wind farm is located in Chautauqua County, Arkwright, and the project is connected to the network in Pomfret. It was installed in 2018 and was developed and operated by EDP Renewables. The 2019 Arkwright Summit Wind Farm is under construction in 2018. In September 2019, more than 100 residents and landowners filed a lawsuit in the New York Supreme Court against EDP Renewables, citing poor health effects due to the placement of turbines too close to homes, as well as lower property values. ARKWRIGHT, N.Y. - Seven of the 36 turbines at the Arkwright Summit Wind Farm in Chautaucoua County and in rotation. Construction of the project began in July 2017, two years after EDP Renewables from Texas chose the site. All turbines are expected to go online and produce electricity by the end of June. Arkwright leaders say the farm will generate about \$1 million a year in new revenue, which will be split between the town, county and three district school districts of the region. As a result, homeowners can expect lower property taxes, and the city will be able to pave many of its dirt roads. We can build a new town hall, I hope we will. Our town hall is extremely inadequate. If the judge has a trial, witnesses should sit in cars, said Supervisor Frederick Norton, R-Arkwright. The project has caused a whirlwind of opposition, namely from the concerned citizens of the Cassadaga Wind Project. While the group states that it is dedicated to promoting the use of renewable renewables Members have called turbines killer skyscrapers that have a negative impact on the environment, property values and their health. While the director of on-site project management and EDP Renewables say the project is safe, the company has an open-door policy to address people's concerns. The Arkwright Summit Of New York has an installed capacity of 78.4 megawatts (MW) - enough to power about 33,000 medium-sized homes in New York City. Arkwright Summit Wind Farm brings significant economic benefits to the community in the form of payments to landowners, local expenses and annual investments of the Arkwright Summit community, representing a capital investment of about \$125 million and paid out \$780,000 in total payments to local authorities until 2019. The project created 80 equivalent jobs during construction, as well as three permanent jobs. Until 2019, about \$4.6 million was spent within a 50-mile radius of the wind farm. Arkwright Summit Wind Farm saves more than 139 million gallons of water each year and displaces carbon emissions from fossil fuel-fired power plants, a major contributor to climate change. Wind energy also improves air quality, helping to mitigate the health effects of harmful air pollutants. Arkwright Summit Wind Farm is compatible with other land uses and provides a stable form of income for local landowners. By 2019, more than \$1 million had been paid to the landowners of the wind farm. These supporting landowners participate in long-term leases and easements that cover turbines, driveways and transfer corridors. Modern wind turbine generators are complex, high-tech machines designed to capture the kinetic energy of wind and convert it into electricity. The blades of the turbine capture the wind and rotate the inner shaft connected to the gearbox, rotating the generator to generate electricity. The tubular steel towers support a hub with three blades attached and a target that contains a shaft, gearbox, generator and controls. Wind measurements are collected to automatically rotate the turbine to collide with the strongest wind and angle, or step, its blades to optimize the energy captured. Electricity must be generated only at the right frequency and voltage to be compatible with the utility network. Arkwright Summit Wind Farm consists of 4 Vestas V110 wind turbines with a capacity of 2 MW and 32 Vestas V110 wind turbines with a capacity of 2.2 MW.
